Physics 239: Homework 1

Fall 2018

Due 10/3/18

In this assignment we will set up the github repository to store your code for this class. This should be pretty straightforward! See the class website for useful links.

1. Download and set up `git` on your computer.

2. Get a github account and authenticate to connect git on your computer with github.

3. Create a repository named `lastname_phys239` where `lastname` is your last name.

4. Add a subdirectory `hw_1`.

5. Put a "Hello world" routine in that directory in whatever language you intend to code in.

6. Push to your github respository.

7. Send me an email at kmsandstrom@ucsd.edu with a link to your github repository so I can clone it.
